

# HEPA Sterilization & UV Air Purification

Your family deserves the cleanest air

## Purify air to 99.7%

Purification is done through a germicidal and photo-oxidation process. The air is pulled into an aluminum UV reaction chamber where the air passes parallel to the UV lamps bombarding it w/ UVC & UVV Light and destroying airborne biological and chemical contaminants in the air. The air then continues through the pre-filter then through the HEPA filter.

The unit can be installed as a stand-alone, as a bypass unit through ducting or it can be directly mounted to the return on your furnace.

**For Residential & Commercial Central Air Systems**
